

2nd Guest Lecture
Bodo Linz
09/25/18

bodo.linz@uga.edu

Today's lecture:

1. ACT – Artemis Comparison Tool
2. PCA – Principal Component Analysis
3. Download a Short Read Archive (SRA) from NCBI
4. lastz and YASRA – Yet Another Short Read Assembler

Let's continue with ACT

We learned how to perform a pairwise genome comparison:

- 1) at the internet (`double_ACT`)
- 2) run locally using `blastall` and `MSPcrunch`

works well for completed genomes

Problem: not suitable for genomes present as contigs

SADLY: most genomes are incomplete

EXAMPLE: *Acinetobacter baumannii* at ncbi genomes

The screenshot shows a web browser displaying the NCBI Genomes search results for the organism *Acinetobacter baumannii*. The URL in the address bar is <https://www.ncbi.nlm.nih.gov/genome/genomes/403?>. The page title is "Genomes - Genome - NCBI". The search bar has "Genome" selected and contains the query "Acinetobacter baumannii". Below the search bar are links for "Organism Overview", "Genome Assembly and Annotation report [3203]", "Genome Tree report [3111]", and "Plasmid Annotation Report [268]". A table lists three genome entries for *Acinetobacter baumannii*:

Organism/Name	Strain	CladeID	BioSample	BioProject	Assembly	Level	Size (Mb)	GC%	Replicons
<i>Acinetobacter baumannii</i>	AB030	19507	SAMN02940899	PRJNA256157	GCA_000746645.1	●	4.33579	39.00	chromosome:NZ_CP009257.1/CP009257.1
<i>Acinetobacter baumannii</i> ACICU	ACICU	19507	SAMN02603140	PRJNA17827	GCA_000018445.1	●	3.99676	38.90	chromosome:NC_010611.1/CP000863.1 plasmid pACICU1:NC_010605.1/CP000864.1 plasmid pACICU2:NC_010606.1/CP000865.1
<i>Acinetobacter baumannii</i> AB307-0294	AB307-0294	19507	SAMN02603889	PRJNA30993	GCA_000021145.1	●	3.76098	39.00	chromosome:NC_011595.1/CP001172.1

Let's download genomes

as contigs to run blastall and MSPcrunch

go to <https://www.ncbi.nlm.nih.gov/genome/>

type the species: *Acinetobacter baumannii*

Select: Genome Assembly and Annotation report

type the isolate: AB4052

click on LRED01 in WGS

The screenshot shows the NCBI Genome page for the organism *Acinetobacter baumannii* strain AB4052. The URL in the browser is https://www.ncbi.nlm.nih.gov/genome/genomes/403?. The page includes a search bar, navigation links for NCBI Resources and How To, and a "Sign in to NCBI" button. Below the header, there are tabs for "Genome" (selected), "Limits", and "Advanced". The main content area displays the organism overview, genome assembly and annotation report, genome tree report, and plasmid annotation report. A search bar at the top of the content area allows for partial, anomalous, or specific level searches. A table below lists the genome details, including the organism name, strain, CladeID, BioSample, BioProject, Assembly ID, Level, size, GC%, replicons, WGS, scaffolds, genes, proteins, release date, modify date, and FTP link. The table shows one entry for *Acinetobacter baumannii* AB4052 with assembly GCA_001612235.1, WGS LRED01, and various genomic statistics.

Organism/Name	Strain	CladeID	BioSample	BioProject	Assembly	Level	Size (Mb)	GC%	Replicons	WGS	Scaffolds	Gene	Protein	Release Date	Modify Date	FTP
Acinetobacter baumannii	AB4052	19507	SAMN03078670	PRJNA261239	GCA_001612235.1	●	3.92134	39.00	-	LRED01	43	3773	3643	2016/04/06	2017/03/20	◆◆

Let's download genomes

click on LRED01.1.fsa_nt.gz, download

unpack: gzip LRED01.1.fsa_nt.gz

rename: mv LRED01.1.fsa_nt LRED01.1.fsa

The screenshot shows a web browser window for the NCBI Sequence Set Browser. The URL in the address bar is <https://www.ncbi.nlm.nih.gov/Traces/wgs/?val=LRED01>. The page title is "Genomes - Genome - NCBI" and the specific project is "LRED00000000.1 Acinetobacter baumannii". The navigation bar includes links for "NCBI Resources" and "How To". Below the header, there is a "Sequence Set Browser" section with a "Show help" link. A search bar contains the project name "LRED01" and a "Search" button. A link to "List of all Projects" is also present. The main content area displays the project name "LRED00000000.1 Acinetobacter baumannii" in blue. Below it are four tabs: "Master", "Contigs", "Proteins", and "Download". The "Download" tab is currently selected. Under the "Download" tab, three file formats are listed with their sizes: "GenBank: LRED01.1.gbff.gz 2.6 Mb", "FASTA: LRED01.1.fsa_nt.gz 1.2 Mb", and "ASN.1: LRED01.1.bbs.gz 2 Mb".

Format	File Name	Size
GenBank	LRED01.1.gbff.gz	2.6 Mb
FASTA	LRED01.1.fsa_nt.gz	1.2 Mb
ASN.1	LRED01.1.bbs.gz	2 Mb

We get

```
>gi|1015746545|gb|LRED01000001.1| Acinetobacter baumannii strain AB4052 LV45_contig000001, whole genome shotgun sequence

sequence
etc.

Let's download genomes

do the same for strain AB5711

The screenshot shows a web browser window for the NCBI Sequence Set Browser. The URL in the address bar is <https://www.ncbi.nlm.nih.gov/Traces/wgs/?val=AHAJ01>. The page title is "Genomes - Genome - NCBI" followed by "AHAJ00000000.1 Acinetoba...". The navigation bar includes links for "NCBI", "Resources", and "How To". The main content area is titled "Sequence Set Browser" with a "Show help" link. It features a search bar with "Project: AHAJ01" and a "Search" button, along with a link to "List of all Projects". Below this, the project name "AHAJ00000000.1 Acinetobacter baumannii AB5711" is displayed in blue. A horizontal menu bar below the project name includes "Master", "Contigs", "Download", and "History". Under the "Download" tab, three file formats are listed with their sizes: "GenBank: AHAJ01.1.gbff.gz 1.7 Mb", "FASTA: AHAJ01.1.fsa_nt.gz 1.2 Mb", and "ASN.1: AHAJ01.1.bbs.gz 963.9 kb".

We get

>AHAJ01000001_1 Acinetobacter baumannii AB5711 ctg7180000006434, whole genome shotgun sequence
TGCGCGCACTTAAAAAGTCGTAGATGAAATGGGTTAACTAACATCCAAATCATGATGCCATTGTA

TTCCCTGCTGAA

**Let's assume we ran blastall and MSPcrunch:
complete genome against genome in contigs**

This is what we get:

All hits against the first contig

Solution: modify the genome format

Solution 1: keep only the first fasta header
remove all following fasta headers

```
>AHAJ01000001.1 Acinetobacter baumannii AB5711.ctg7180000006434, whole genome shotgun sequence
TGCGCGCGACTTAAAAAGTTCTAGATGAAATGGGTTAACATACCAAAATCATGATCCCATTGTA
CGTACAGTGTCTGAAGCAAAACCGTCATTGAGTTTTAGCTCAAAATTGGCTTAGCTGAAGCGTGGTGAGAA
TGGCTTAAAGTCATCATGATGTGTGAATTACCAACTAACGTTAACACTGGCTTTGACCGTGAC
ACTTCGATGGCTTCACTATCGGTTCCAAACGGACTTAACCTCAGGTTAACACTGGCTTTGACCGTGAC
TCTGGTATTGTTCTCACTTGTGATGAGCGTGTGCTGCTGCTAAAGCTCTCTTCAATGGCAATT
ATGCTTGCGTAAAGCTGGTAAATATGTCGGTATCTGTGGTCAAGGACCATCAGACCACCCAGACCTTGC
AAAATGGTTAATGGAGCAAGGCATTGAATCAGTATCTCTAACCTGACTCGGTTTAGACACATGGTTC
TTCCTTGCTGAA
AGTTCTGCAAGTGCTTTGATTGCGTCTTCGGGATAAAAGTCGAGGTGTATCGGAAAAGTTGCTA
GGTAGCGAGCGATACGGGTACTGCTCTGTAACGCTGCCCTTATGGTCATAACAGGTACTTGGCCAC
TTTACTGAGCAAAGGAACCTTCGCTCCAAGAATGCCGTTGTAATTAAATCGCTTGTATGGGATTGCCCTTA
AATTCAAAAGCTTGTCAACTTTGGCAAATGGAGAAATTGCCATTGATGCAAAAATAATCGGACA
TTTATTCAACCTTATTGCTGTTGCTCTCAGTTCTTTGGAACTAATTATAAAATAC
AGAATGTCCTTTAAGTCAAACTATTTGATGACGACCAAGTTCAAAATATAAAAAAGACGC
```

```
printf ">AHAJ01000001.1\n" > AHAJ01.fa
# print everything between " "
# and save as file AHAJ01.fa
cat AHAJ01.1.fsa | grep -v ">" >> AHAJ01.fa
# >> add to file AHAJ01.fa and save

# What will the grep command do?
```

>AHAJ01000001.1

Solution: modify the genome format

OR (a little more sophisticated)

```
printf ">AHAJ01000001.1\n" > AHAJ01.fa
cat AHAJ01.1.fsa \
| awk '{
    if(substr($1,1,1) == ">") {
        printf "";
    }else{
        printf "%s",$1;
        printf "\n";
    }
}' >> AHAJ01.fa
```

substr: substring

```
# if $1 at position 1 for 1 character = ">", print nothing
# else print
# printf "%s" - take the first of the following arguments ($1) and
print it as a string (s), "%d" - as a number (decimal)
# then print "\n"
# >> add to file AHAJ01.fa
```

Solution: modify the genome format

- What we get: very simple, One fasta header, followed by sequence
- Can be used for genome comparison (blastall and MSPcrunch)
- useful for having a quick look
- e.g. make comparison to find a gene in target genome
- what if: want to keep tract of contig numbers to
 - order and orient contigs based on reference genome
 - close the genome
- concatenate contigs into a single supercontig
- want to keep contig numbers

Closing the genome

165 contigs

target sequences near
both ends of the contig

extract seq reads containing
the target sequence

concatenate extracted reads

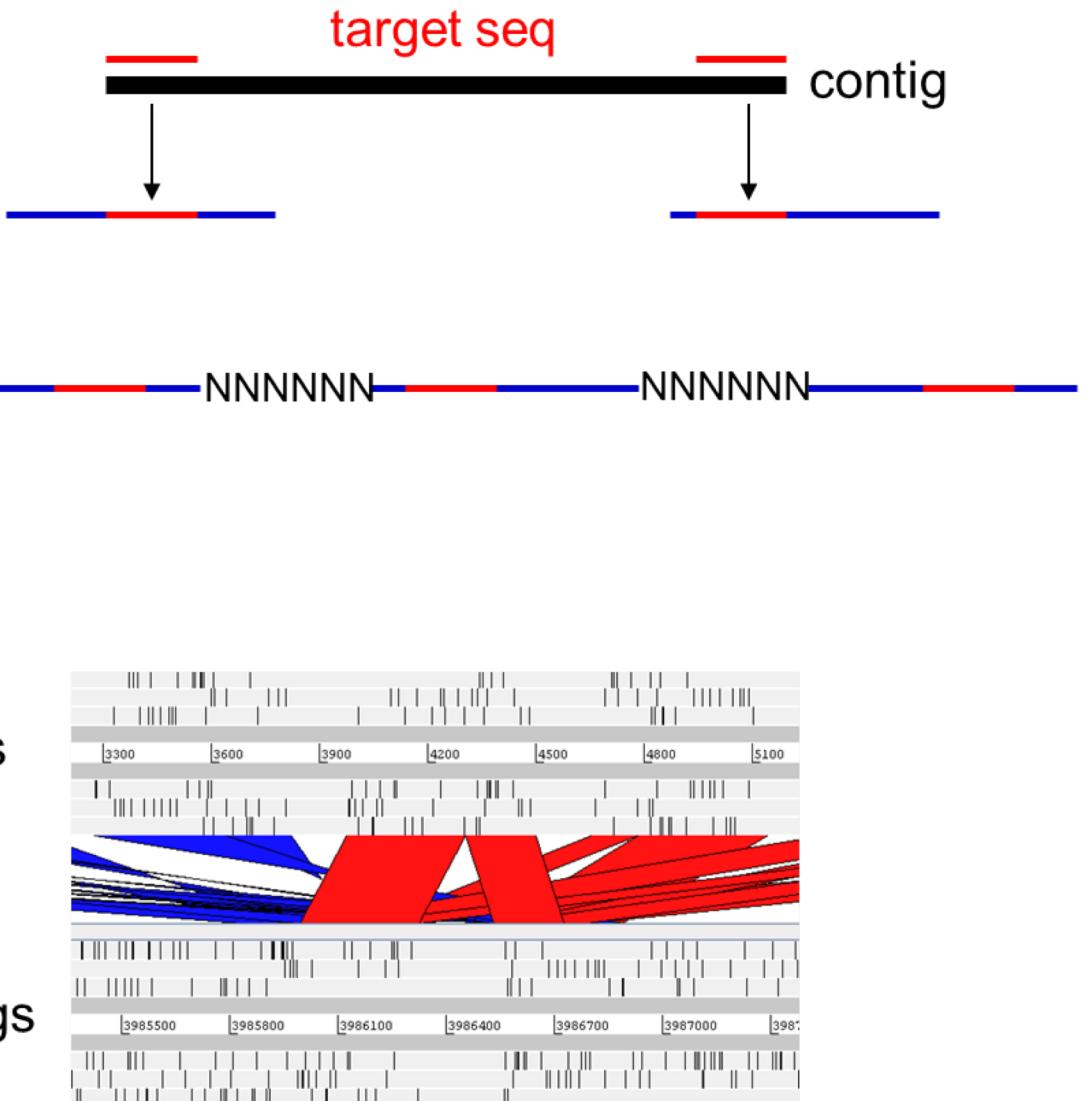

concatenate contigs

run genome comparison

visualize in ACT

Reads

Contigs

Modify the genome format

- two different formats of genome headers: make same format

```
>AHAJ01000001.1 Acinetobacter baumannii AB5711 ctg7180000006434, whole genome shotgun sequence  
TGCGCGCACTTAAAAAGTCGTAGATGGGTTAACTAACATCCAAATCATGATCCCATTGTA  
CGTACAGTGTCTGAAGCAAAACGCGTCATTGAGTTTTAGCTAAAATTGGCTTGAAGCGTGGTGGAA  
TGGCTTAAAGTCATCATGATGTGAATTACCAACTAATGCATTGTTAGCTGAACAATTCCCTGAAC
```

```
>gi|1015746545|gb|LRED01000001.1| Acinetobacter baumannii strain AB4052 LV45_contig000001, whole genome shotgun sequence  
ACAAACCCGGTACGGTCAATTAGATGGTGAATTGCGCAAAATTTTGTACAGCGAAATTCTTAAA  
AGGTCAAGGGCAAAGTCGATCAACTTAAAGCCGATTATAAAGGCAATGTGAATTCTCATTTCAGCCT  
TAAGGAGTTGTCATGAGTGTACTAGAAGGCCAACATATTCTGACTTTCTAACAGCAAAAGCCAG
```

- problem: ACT doesn't take numbers
- solution: letter code for contig numbers, IUPAC
- start the contig with a 5 letter contig code
- followed by nn to separate from sequence
- separate contigs by stretches of N's (~300)

e.g. ...NNNNNAAAGTnnACGTATGCAT...

IUPAC	
0	- A
1	- G
2	- C
3	- T
4	- R (G or A)
5	- Y (C or T)
6	- M (A or C)
7	- K (G or T)
8	- S (G or C)
9	- W (A or T)

Solution: modify the genome format

```
#!/bin/bash
# runContigstoACT.sh
# Author Bodo Linz
# run blast of *.fna or *.fsa file in the current directory
# against a specified reference sequence (database)
# generate the *.cmp file for ACT
```

```
BLASTALL=~/bin/blastall
MSPCRUNCH=~/bin/MSPcrunch
DATABASE=AbPK1.fasta
NAME1=${DATABASE%".fasta"}
GENOME2=AB4052_LRED01.fsa
NAME2=${GENOME2%"_LRED01.fsa"}
```

Completed reference genome

Target genome as contigs

```
# Based on the previous lecture:
# What is NAME1?
# What is NAME2?
```

Note the different headers

```
>AHAJ01000001.1 Acinetobacter baumannii AB5711 ctg7180000006434. whole genome shotgun sequence
TCCCGCGCACTTAAAAAGTTCTGATGAAATGGGTTAACATAACATCCAAATCATGATCCATTGTA
>gi|1015746545|gb|LRED01000001.1| Acinetobacter baumannii strain AB4052 LV45_contig000001. whole genome shotgun sequence
ACAAACCGGTACGGTCAATTAGATGGTGAATTGCGCAAAATATTTTGATACAGCGAAATTCTTAAA
```

```
# modify genome input file to format ">LRED01000001.1"
cat $GENOME2 \
| awk '{
    if(substr($1,1,3) == ">gi"){
        printf ">";
        printf substr($1,19,14);
        printf "\n";
    }else{
        printf "%s", $1;
        printf "\n"
    }
}' \
> tempgenome.fsa
```

Let's walk through

```
>gi|1015746545|gb|LRED01000001.1| Acinetobacter  
cat $GENOME2 \  
| awk '{  
    if(substr($1,1,3) == ">gi") {  
# if at pos $1 the substring starting from character 1 for 3 characters  
# equals (exactly) ">gi"  
        printf">>;  
        printf substr($1,19,14);  
        printf"\n";  
# then print ">"  
# then print the substring of 14 characters starting from character 19  
# which is "LRED01000001.1"  
# then print "\n" (carriage return)  
    }else{  
        printf"%s",$1;  
        printf"\n"  
# if criterion is not met, print all lines, then print "\n"  
    }  
}' \  
>tempgenome.fsa
```

We Get: >LRED01000001.1

>AHAJ01000001.1 Acinetobacter baumannii AB5711 ctg7180000...

→ We took care of the different headers

Let's walk through

```
printf ">\"$NAME2\" Contigs\n" > $NAME2.fa
# print ">" and $NAME2 (=AB4052_LRED01) Contigs followed by "\n"
# and save this as file fake
# >AB4052_LRED01 Contigs

cat tempgenome.fsa | awk -v FS="\n" -v OFS="" '{print $1}' | awk -v
FS=" " -v OFS="\t" '{print $1}' \
| tr "0" "A" | tr "1" "G" | tr "2" "C" | tr "3" "T" | tr "4" "R" | tr
"5" "Y" | tr "6" "M" | tr "7" "K" | tr "8" "S" | tr "9" "W" \
# FS=" " -v OFS="\t" replaces space in header by tab
# tr - translate/transliterate, replace or remove specific characters
# syntax: tr "what to search for" "what to replace with"
# here: replace the numbers by IUPAC letters
```

Let's walk through

```
echo ""
echo "Done generating the contig file"
echo "-----"
echo ""

# has the database already been formatted?

if [ -f ${DATABASE}.nhr -a ${DATABASE}.nin -a ${DATABASE}.nsd -a
${DATABASE}.nsi -a ${DATABASE}.nsq ]; then \
    echo "The database is already formatted"
else
    formatdb -i ${DATABASE} -p F -o T
    echo "Done formatting the database ${GENOME1}.fasta"
fi

# if -f(file) ${DATABASE}.nhr -a(nd) ${DATABASE}.nin etc. exist
# then display "The database is already formatted"
# else run formatdb
```

Then run blastall and MSPcrunch as before (see last lecture)

128 *Bordetella* genomes

95 classical bordetellae:

- 58 *B. bronchiseptica*
- 2 *B. parapertussis*
- 34 *B. pertussis*

respiratory pathogens in animals and humans

34 non-classical bordetellae:

- 18 *B. holmesii*
- 6 *B. hinzii*
- 1 *B. avium*
- 4 *B. trematum*
- 2 *B. ansorpii*
- 3 *B. petrii*

respiratory pathogens in animals and in immuno-compromized humans

wound and ear infection in humans

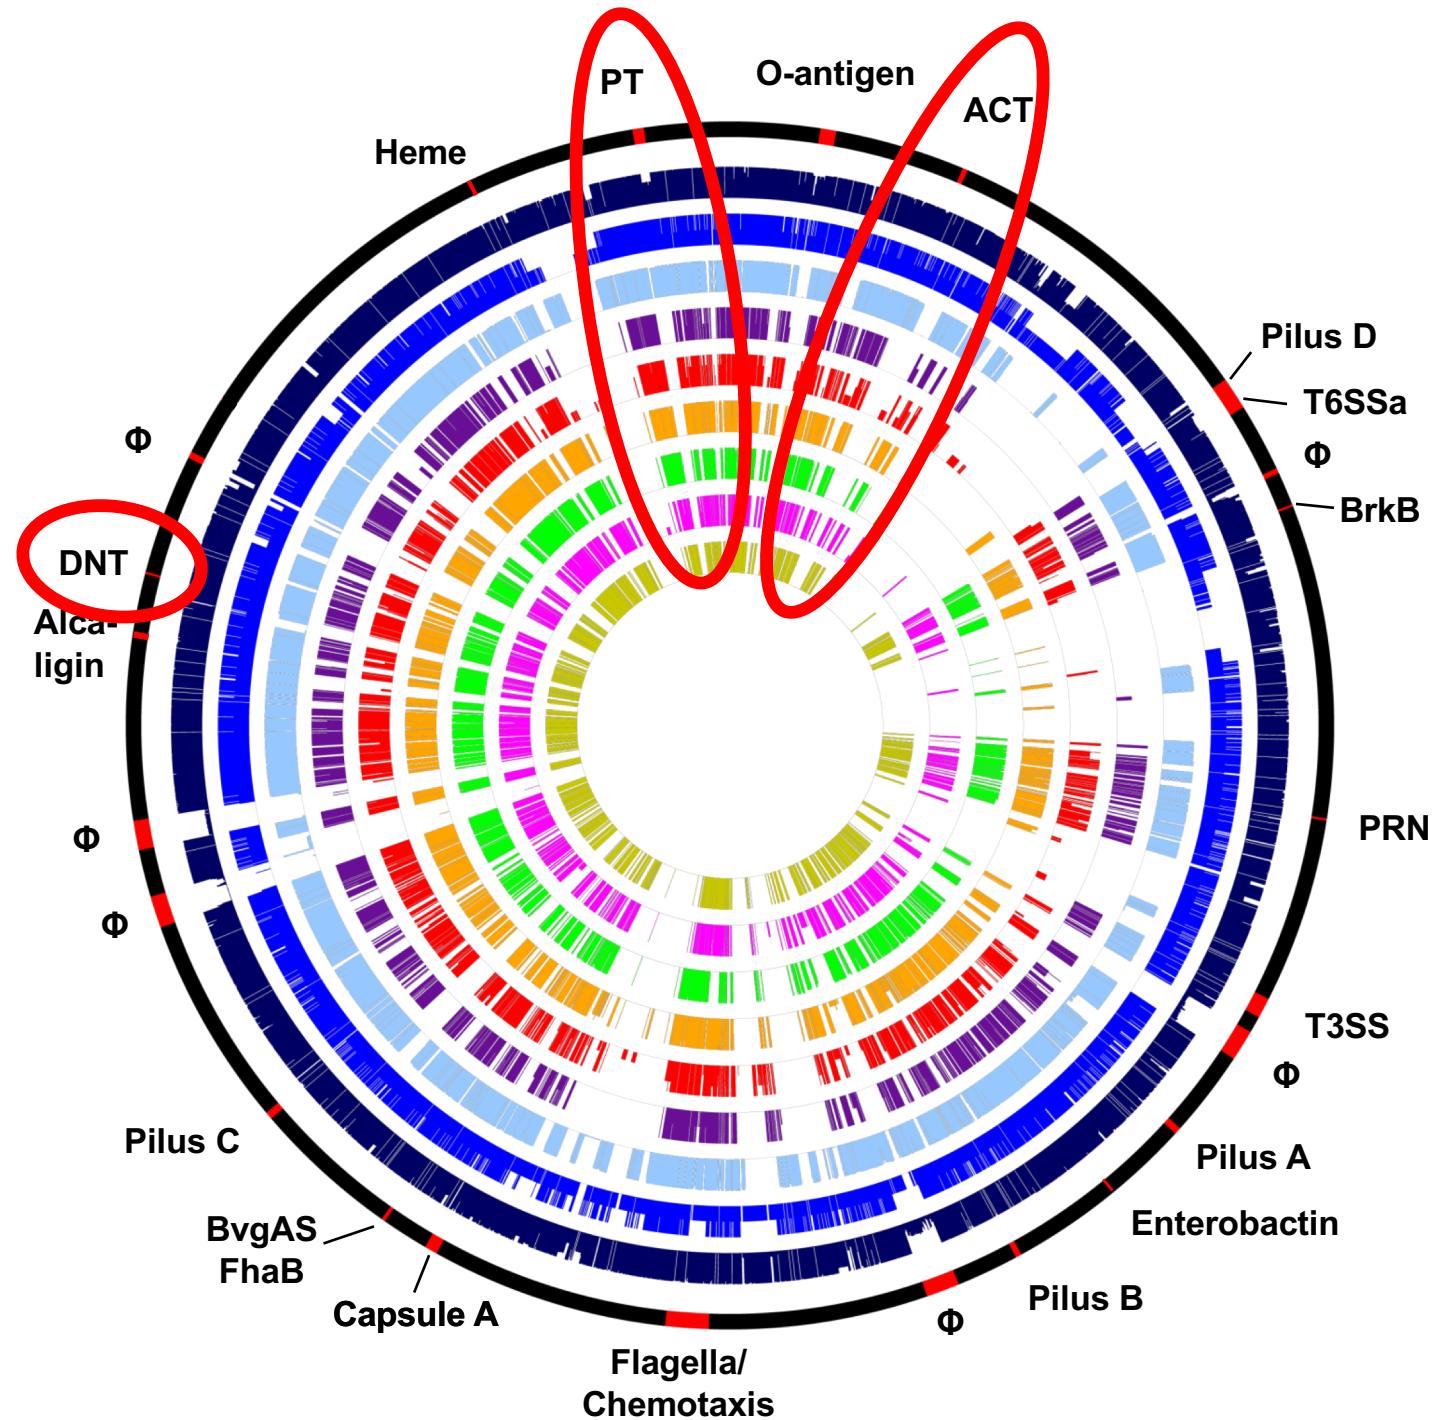

environmental / ear infection in humans

questions

- virulence-associated factors determining host specificity?
- virulence-associated factors determining disease outcome?

Approach

- genome-wide SNP-based phylogenetic tree
- genome-wide presence/absence of genes
 - similar evolutionary trends?
- Pairwise genome comparisons (ACT)
(Artemis Comparison Tool)
- mapping of virulence-associated genes
- Principle Components Analysis (PCA)

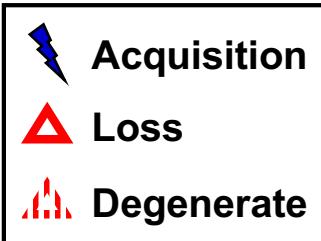

Circles

- 1: Virtual chromosome of *B. bronchiseptica* RB50 with genes of interest;
- 2: *B. bronchiseptica* (based on 58 genomes);
- 3: *B. parapertussis* (2);
- 4: *B. pertussis* (34);
- 5: *B. ansorpii* (2);
- 6: *B. petrii* (3);
- 7: *B. hinzii* (6);
- 8: *B. holmesii* (18);
- 9: *B. trematum* (4);
- 10: *B. avium* (1)

Non-classical species lack toxins of the classical species:
Pertussis Toxin (PT)
ACT
DNT

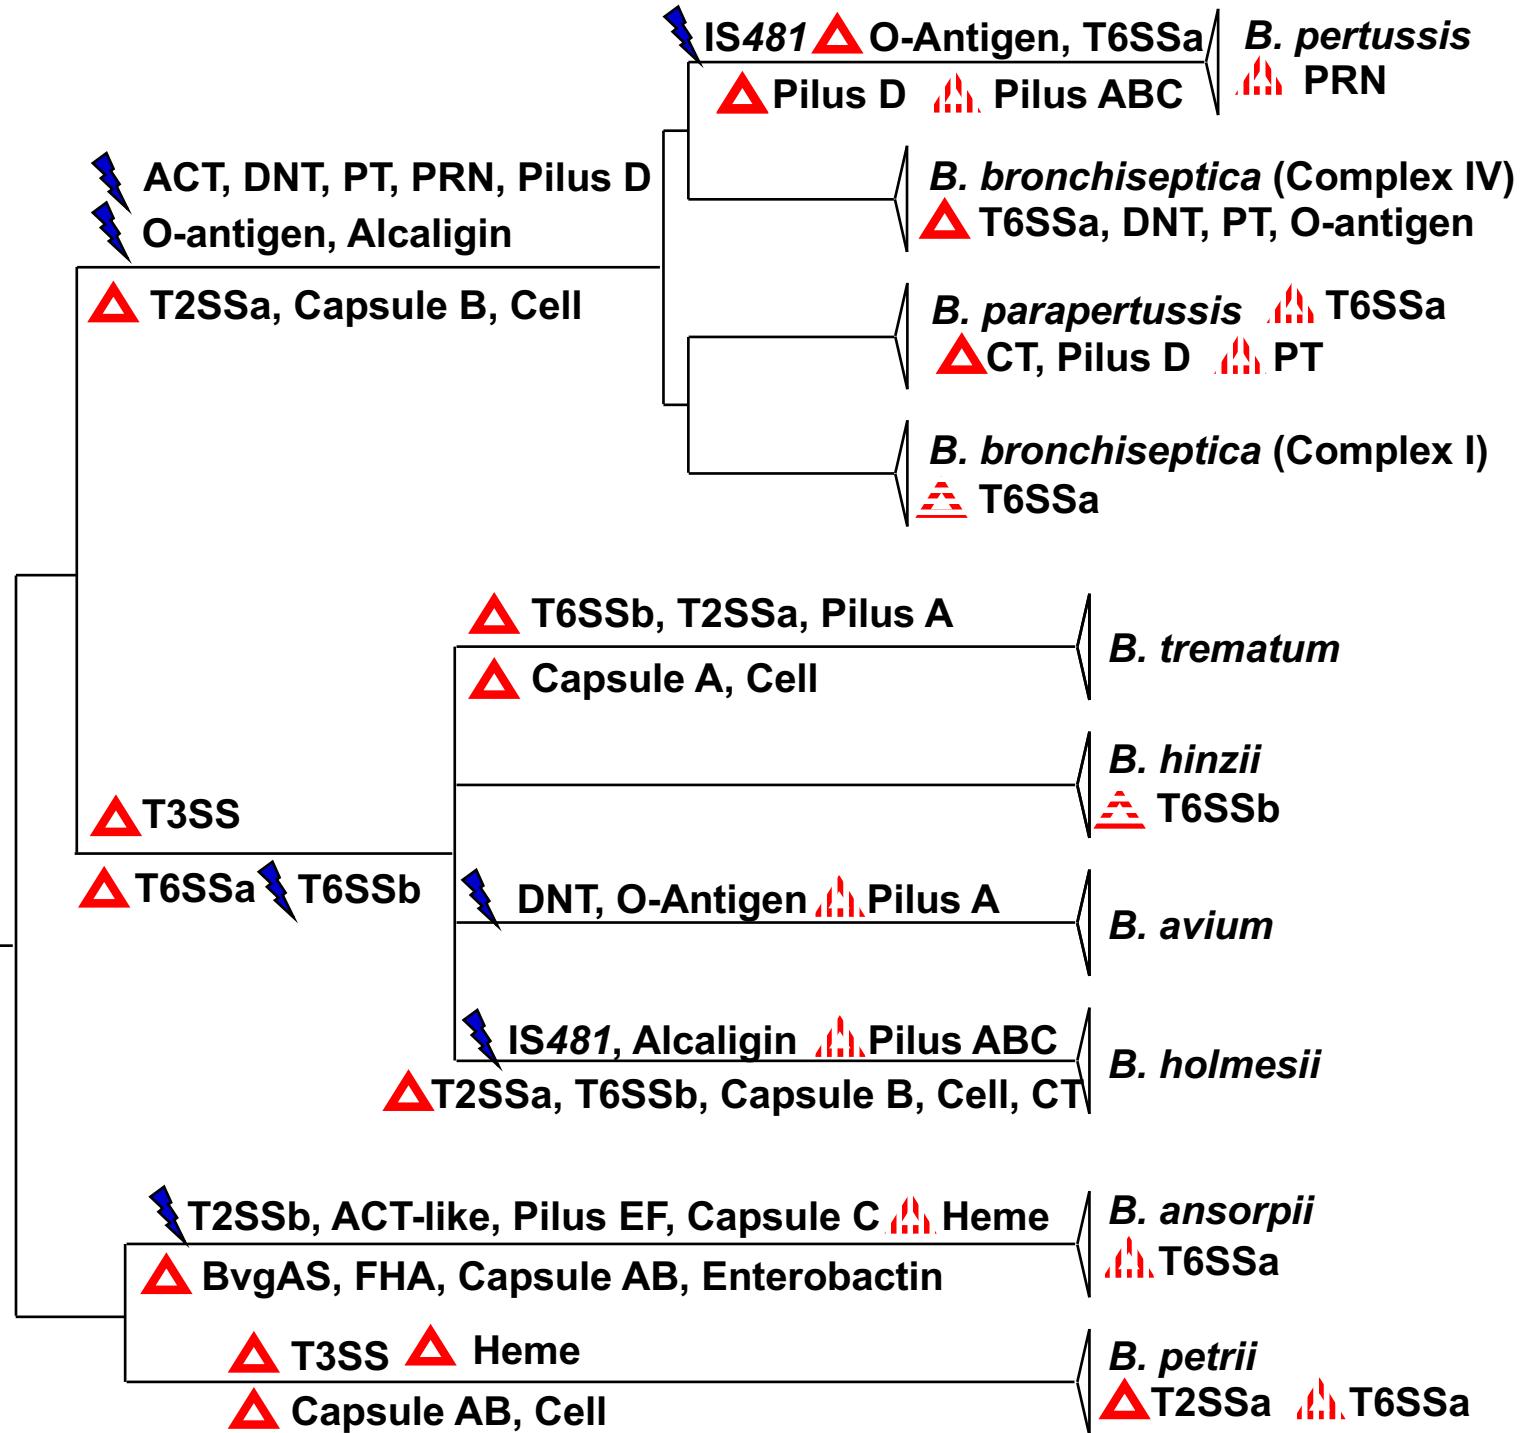

Presence and absence of virulence-associated key factors

Presence and absence of virulence-associated key factors:

Are there similarities or trends to explain:

- host spectrum?
- infected organs?
- disease outcome?

Principal Component Analysis (PCA)

- invented in 1901 by Karl Pearson
- statistical procedure that converts a set of observations of possibly correlated variables into a set of values of linearly uncorrelated variables called principal components (PCs)
- Principal Components are the underlying structure in the data
- PCA mostly used as a tool in exploratory data analysis
- it reveals the internal structure of the data
- in a way that best explains the variance in the data
- PC1 has the largest possible variance
 - accounts for as much of the variability in the data as possible
- PC2 second largest variance in the data
- PC3 third largest
- resulting PCs are uncorrelated

Input

- based on numbers
- change nucleotides to allele numbers (e.g. A=1, C=2, G=3, T=4)
- here presence and absence of genes as 1 and 0
- computation in R using libraries gplots, gdata, and gtools

computation of PCA

```
library(gplots)
library(gdata)
library(gtools)

rm(list = ls())
g<-as.matrix(read.table("D:/Data/Virulence.txt",
row.names=1,header=TRUE,check.names=TRUE, sep = "\t") )
h <- as.matrix(dist(g))
print(summary(pc<- princomp(h, cor=T) ))
pc$loadings
pc$scores
ghil <- as.table(pc$scores)
ghi2 <- as.table(pc$loadings)
write.table(ghil, file="D:/Data/PCA_scores.txt", sep="\t",
row.names=T, col.names=T)
write.table(ghi2, file="D:/Data/PCA_loadings.txt", sep="\t",
row.names=T, col.names=T)
```

Let's walk through:

```
library(gplots) # load library (gplots)
library(gdata) # load library (gdata)
library(gtools) # load library (gtools)

rm(list = ls()) # empty memory, optional

g<-as.matrix(read.table("D:/Data/Virulence.txt",
row.names=1,header=TRUE,check.names=TRUE, sep = "\t") )
# read table "D:/Data/Virulence.txt" in matrix format into file "g"
# row.names=1 - table has 1 row name
# you can have several such as strain, year, country, etc)
# header=TRUE,check.names=TRUE - table has headers, check that
# column headers are unique
# sep = "\t" - columns are separated by tab
h <- as.matrix(dist(g))
# make distance matrix of file g
```

Let's walk through:

```
print(summary(pc<- princomp(h, cor=T)))  
pc$loadings  
pc$scores  
  
# run principal component analysis of file h, save as pc  
# print summary of data: pc$loadings and pc$scores  
  
ghil <- as.table(pc$scores)  
ghi2 <- as.table(pc$loadings)  
  
# output of pc$scores in table format into file ghil  
# output of pc$loadings in table format into file ghi2  
  
write.table(ghil, file="D:/Data/PCA_scores.txt", sep="\t",  
row.names=T, col.names=T)  
  
write.table(ghi2, file="D:/Data/PCA_loadings.txt", sep="\t",  
row.names=T, col.names=T)  
  
# save ghil in table format as file "D:/Data/PCA_scores.txt"  
# fields separated by tab, file has row names and column names  
# save ghi2 in table format as file "D:/Data/PCA_loadings.txt"
```

Output PCA_scores

Load in Excel and plot pairwise

A Species

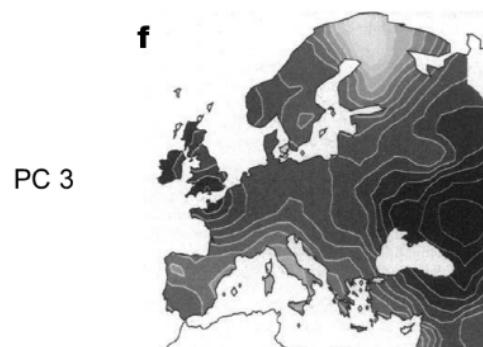

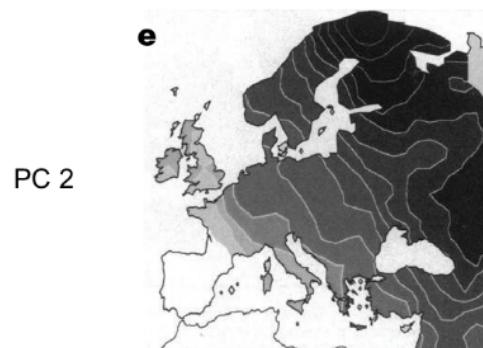

B Host and disease

Supplementary Figure 4. Principal Component Analysis of presence/absence of virulence-associated factors in *Bordetella* genomes by A) *Bordetella* species; B) host and disease. The genomes from each species were grouped by presence/absence of individual factors, and any unique combination of factors was analyzed as separate data entry resulting in several data points per species. PC1 divides the classical from the non-classical species, PC2 isolates *B. ansorpii*, and PC3 separates the genomes of the human-restricted *B. pertussis* and *B. holmesii* from those of the other species. Bb *B. bronchiseptica*; Bpp *B. parapertussis*; Bp *B. pertussis*; Bhl *B. holmesii*; Bhz *B. hinzii*; Bav *B. avium*; Bt *B. trematum*; Bpet *B. petrii*; Ban *B. ansorpii*

Example from human genetics: Allele frequencies of 95 allozymes in Europe and the Middle East

Clinal gradients in
principal components
1–3 in allozyme allele
frequencies in
Europeans

Piazza et al., (1995).
Genetics and the origin
of European languages
Proc. Natl. Acad. Sci. USA
Vol. 92, pp. 5836-5840

Example from human genetics and the human stomach bacterium *Helicobacter pylori*: Allele frequencies of 95 allozymes and *H. pylori* gene sequences in Europe and the Middle East

Similar clinal gradients between principal components 1–3 in European *H. pylori* and humans

PC 1

PC 2

PC 3

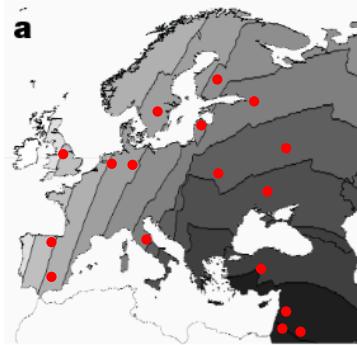

Linz et al., (2007).
An African origin for the intimate association between humans and *Helicobacter pylori*
Nature Vol. 445, pp. 915-918

Clinal gradients in principal components 1–3 in allozyme allele frequencies in Europeans

Piazza et al., (1995).
Genetics and the origin of European languages
Proc. Natl. Acad. Sci. USA
Vol. 92, pp. 5836-5840

PCA of gene sequences from *H. pylori* in Europe

PC 1

- concatenated MLST sequences of *H. pylori* sampled from patients at multiple locations
 - grouped by sampling location
 - changed nucleotides to allele numbers
 - ran PCA
 - subjected data from each individual PC to spatial autocorrelation analysis in GS+ 7.0 (Geostatistics software for the Environmental Sciences)
 - extrapolated data points throughout the grid
 - plotted onto a synthetic map of Europe using arcGIS
-
- clines originally interpreted as genetic signatures of episodic migratory events:
 - PC1: spread of agriculture from Middle East to Europe
 - PC2: introgression of Uralic speaking peoples from northern Siberia into northern Europe (Lapps, Finns, Estonians, Hungarians)
 - PC3: Spread of the Kurgan culture (pastoral nomads) from Eurasian steppes after domestication of the horse

PC 2

PC 3

Let's change the topic:

How to get a specific gene sequence from a short read archive

We will:

Download a Short Read Archive (SRA) from NCBI

extract reads for
a specific gene

assemble the gene
sequence from the reads

Download a short read archive (SRA) from NCBI

The only option: use the sratoolkit from NCBI

- to download sratoolkit, type:

```
wget ftp://ftp-
trace.ncbi.nlm.nih.gov/sra/sdk/current/sratoolkit.current-
centos_linux64.tar.gz
```

or wherever the program is currently located at the ncbi website

- to unpack the toolkit, type:

```
tar -xzf sratoolkit.current-centos_linux64.tar.gz
```

- location of fastq-dump and other commands:

```
~/[user_name]/sra-toolkit/bin/fastq-dump
```

Download a short read archive (SRA) from NCBI

```
~/[user_name]/sra-toolkit/bin/fastq-dump
```

- go to the /bin directory
- Since the documentation is pretty minimal, here is the command line to type:

```
./fastq-dump --outdir ~/bodo.2/Bhinzii/fastq  
--skip-technical --readids --dumpbase --split-files --clip  
SRR_ID
```

```
# ./fastq-dump – start the command fastq-dump in the current directory “.”  
# --outdir – specify the output directory, here ~/bodo.2/Bholmesii/fastq  
# --skip-technical – dump only biological reads, skip info such as:  
Application Read Forward -> Technical Read Forward <- Application Read  
Reverse - Technical Read Reverse.
```

```
# --readids – append the real read-ID after spot ID ‘accession.spot.readid’  
# --dumpbase – formats sequence using base space (default other than SOLiD)  
# --split-files – Dump each read into separate file. Files will receive suffix corresponding to  
read number.  
# --clip SRR_ID – change the SRR_ID to whatever the ID is, e.g. SRR942665
```

Download a short read archive (SRA) from NCBI

Let's assume we downloaded the paired reads:
SRR942665_1.fastq and SRR942665_2.fastq

Let's have a look at the FASTQ format, it's in 4 lines:

@SEQ_ID
SEQUENCE

+ (sometimes with seqID again)

QUALITY_SCORES_FOR_ALL_NUCLEOTIDES

e.g.

```
@SRR942665.3.1 SOLEXA4:47:D1RLFACXX:6:1101:2945:2102 length=101
TTCTGTGGAAAGGTGAGGTCATCGACGTCGGCGTGCAGGCCACTTGTCAGGC
AGTCCCAGGCCAGGGCGCGCATGGCCAGGCC
+
CCCCFFHHFHIGGIIEEEHHJHGIIJJJIG@AGGIHGIGEADDDDBDBBBDDDDCDCCBBC
DDDDC@BDBBDBBBBBBBB@B<@DBDABBD
```

quality value characters in left-to-right increasing order of quality ([ASCII](#)):

#\$%&'()*+,-./0123456789::<=>?@

ABCDEFGHIJKLMNOPQRSTUVWXYZ[\]^_`abcdefghijklmnopqrstuvwxyz{|}~

Download a short read archive (SRA) from NCBI

Join the paired reads:

SRR942665_1.fastq and SRR942665_2.fastq using FLASH

Magoc and Salzberg (2011). FLASH: fast length adjustment of short reads to improve genome assemblies. *Bioinformatics* **27**: 2957-2963.

- very accurate and fast tool to merge overlapping paired-end reads
- Merged read pairs result in unpaired longer reads
- Longer reads are more desired in genome assembly and analysis processes

```
flash <mates1.fastq> <mates2.fastq> [-m minOverlap] [-M  
maxOverlap] [-x mismatchRatio]
```

```
flash SRR942665_1.fastq SRR942665_2.fastq -m 10 -M 100 -x 0.1
```

results in:

```
out.extendedFrags.fastq  
out.notCombined_1.fastq  
out.notCombined_1.fastq  
out.hist  
out.histogram
```

Download a short read archive (SRA) from NCBI

Joined paired reads in: `out.extendedFrags.fastq`

rename: `mv out.extendedFrags.fastq SRR942665_joined.fastq`

Let's extract the reads for a certain membrane transporter gene (locus_tag BB1335 in *B. bronchiseptica* RB50) to check for a frameshift mutation in this *B. hinpii* genome using `lastZ` and `YASRA`

Harris, R.S. (2007) Improved pairwise alignment of genomic DNA. Ph.D. Thesis, The Pennsylvania State University. (<http://www.bx.psu.edu/~rsharris/lastz/>)

Expected length without frameshift: 1416 bp

Expected length with -1 frameshift: 1415 bp

Let's dig in:

```
cat SRR942665_joined.fastq | ...
```

```
cat SRR942665_joined.fastq | lastz BB1335.fa[nameparse=darkspace]  
/dev/stdin[nameparse=-full] --yasra90 --coverage=75  
--ambiguous=iupac --format=general:name1,zstart1,end1,  
name2,strand2,zstart2,end2,nucs2,quals2  
| grep -v "^#"  
| awk -v FS="\t" '{print $0,$4}'  
| uniq -u -f 8  
| awk -v FS="\t" -v OFS="\t" '{print $1,$2,$3,$4,$5,$6,$7,$8,$9}'  
| sort -k 2,2n -k 3,3n  
| ~/bodo.1/bin/YASRA-2.33/src/assembler -r -o -c -h /dev/stdin  
> Bhinzi5132_BB1335_consensus.fa
```

➤WOW!

➤DON'T PANIC !!!

➤Let's walk through ...

```
cat SRR942665_joined.fastq # open file
| lastz BB1335.fa[nameparse=darkspace] /dev/stdin[nameparse=-
full] # call the program lastz, which aligns the reads against
sequence BB1335.fa, our target gene
--yasra90 --coverage=75 # min identity 90%, min length 75%
--ambiguous=iupac # IUPAC Nucleotides allowed
--format=general:name1,zstart1,end1,
name2,strand2,zstart2,end2,nucs2,quals2 # format
# name1,zstart1,end1 - our target sequence BB1335.fa
# name2,nucs2,quals2 - sequencing reads to align
| grep -v "^\#" # don't select reads that start with bad quality
| awk -v FS="\t" '{print $0,$4}' # print all $ plus $4 again
| uniq -u -f 8 # take only lines where field 8 ($8 = nucs2) is
unique sequence = if duplicated sequence take only once
| awk -v FS="\t" -v OFS="\t" '{print $1,$2,$3,$4,$5,$6,$7,$8,$9}' #
print all fields again
| sort -k 2,2n -k 3,3n
# sort by increasing position in target, first start then end
| ~/bodo.1/bin/YASRA-2.33/src/assembler -r -o -c -h /dev/stdin
# run the assembler
> Bhinzii5132_BB1335_consensus.fa
# save
```

Created consensus sequence: Bhinzi5132_BB1335_consensus.fa

```

How many nucleotides?

Well, you know what to do:

```
printf "Bhinzii5132 consensus\n" > Bhinzii5132_BB1335.fa
cat Bhinzii5132_BB1335_consensus.fa
| awk '{
    if(substr($1,1,1) == ">") {
        printf "";
    }else{
        printf "%s", $1;
    }
} END{printf "\n"}' \
>> Bhinzii5132_BB1335.fa

cat Bhinzii5132_BB1335.fa | wc -L

# wc -L prints the length of the longest line
# Result: 1415
# That means, we are dealing with the frameshift gene variant
```

Thank you.
